DETAILED ACTION

1. The response filed has been fully considered. Due to the indefiniteness of the claims, the claims read reasonably read on DNA biosensors.

THE FOLLOWING IS A NEW GROUND OF REJECTION NECESSITATED BY THE AMENDMENT

Claim Objections

2. In claim 1 the designation a) before “comprises” is improper . The designation should be inserted after “comprises” and before “charge transfer components”.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-8,10-20,22-24 are rejected under 35 U.S.C. 102(b) as being anticipated by Nakayama (EP0450862A2 September 10, 1991).

Nakayama et al teach an organic thin film element. They teach a organic thin film layer (12) and insulating layer (3) and a layer of polycyclic aromatic group molecules or derivative thereof (5) (see whole doc. esp. Figure 3). They teach that the charge transfer complex forms to cause transit from neutral to ionic state between the layers (see col. 9 line 55-col. 10 line 7).

Art Unit: 1656

They teach that polycyclic aromatic group that may be organic compounds such naphthalene, anthracene (see col. 6 line 1-40). They teach donor and acceptor molecules stacked in the charge transfer complex crystal (see col. 8 line 34-55). They teach forming film via chemical bonding such as silane derivative in which the polycyclic aromatic group molecules is used to cause a condensation reaction with hydroxyl groups on surface of an insulating layer (Si₂) (see col. 7 lines 16-2).

SUMMARY

4. Claims 9 & 21 objected for are free of the prior art. There is no prior art that teach a DNA molecule in which one strand is bound to substrate of claimed device and other strand bound to charge transfer material. The closest prior art is Nakayama et al who teach organic thin film element but do not teach or suggest a DNA molecule in which one strand is bound to substrate of claimed device and other strand bound to charge transfer material.

Conclusion

5. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO**

Art Unit: 1656

MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.
